INTRODUCTION
The following instructions apply to assembling scoop mounts to Venus, Atlas, Luna, Earth, Polaris, Delta, Neptune, Neptune Plus, Orion Plus, Saturn Plus, Titan Plus and Jupiter Plus Planetgear™ 7000 speed reducers. Instructions for Orion Plus, Saturn Plus, Titan Plus, and Jupiter Plus, are also valid for Orion, Saturn, Titan, and Jupiter, respectively. These scoops are drilled for standard T-frame and IEC motors. Reference Scoop Mount Assembly Configurations (pages 4-11) for motor frame size capabilities, scoop mount part numbers and scoop mount assembly configurations.

NOTE: Consult Rexnord for any reducer/motor combinations not listed, fluid couplings or other devices that require a coupling gap larger than 1/4" (6 mm).

ASSEMBLY OF SCOOP MOUNT
(No Fan and Fan Shroud Requirements)

1. Determine the scoop mount assembly configuration for the appropriate reducer/motor combination. Reference Scoop Mount Assembly Configurations (Pages 5-12) for the appropriate assembly drawing that corresponds to the scoop mount assembly configuration.

2. Venus/Atlas/Luna/Earth/Polaris/Delta — Remove 6 - 1/2" bolts from input shaft side as shown in Figure 1.
   Neptune/Neptune Plus/Orion Plus/Saturn Plus/Titan Plus/Jupiter Plus — Remove 10 - 1/2" bolts from input shaft side as shown in Figure 2.

3. Position each side bracket to the appropriate side of the input shaft and attach loosely to the reducer.

4. Position and attach the mounting plate to the side brackets. Reference Scoop Mount Assembly Configurations (Pages 5-12) for correct orientation and mounting hole configuration.

5. Center and level the mounting plate with respect to the input shaft.

   a. Centering (Reference Figure 3)
      (1) Clamp a piece of key stock to the keyway in the input shaft (or flush to the shaft on a metric input shaft), extending it past the end of the mounting plate.
      (2) Rotate the input shaft so that the key stock is exactly in the 12 o’clock position.
      (3) With a carpenters square, measure from the key stock to any set of mounting holes the mounting plate to see if they are equal distance from the key stock. Make adjustments to the position of the mounting plate if necessary.

   b. Leveling
      (1) Clamp a piece of key stock to the keyway in the input shaft (or flush to the shaft on a metric input shaft), extending it past the end of the mounting plate.
      (2) With a combination square, measure the distance between the key stock and the mounting plate in two places; as close to the shaft as possible and at the end of the mounting plate. If measurements are different use the jack bolts to level mounting plate.

6. Tighten all bolts. Reference Table 1 for recommended bolt torques.

* The torques shown produce a clamp load of 80% of proof load. They assume clean, dry threads with a torque coefficient of 0.2, and a coefficient of friction of 0.14. Plated threads, need only 3/4 torque shown. Well lubricated threads need only 1/2 torque shown.

ASSEMBLY OF SCOOP MOUNT
(Fan and Fan Shroud Requirements)

1. Reference Scoop Mount Assembly Configurations (Pages 5-12) to determine the appropriate configuration and assembly drawing for each reducer/motor combination.

2. Remove fan shroud from reducers input end.

3. Loosen set screws on fan and remove fan from input shaft.

4. Remove key from shaft.

5. Venus/Atlas/Earth/Polaris - Remove 6 - 1/2" bolts from input shaft side as shown in Figure 1 (Page 1).
Neptune/Saturn/Titan/Jupiter - Remove 10 - 1/2" bolts from input shaft side as shown in Figure 2 (Page 1).

6. Position each side bracket to the appropriate side of the input shaft and attach loosely to the reducer. At the same time, position and attach the shroud clips over the side bracket. Reference Figure 4.

7. Position and attach the mounting plate to the side brackets. Reference the Scoop Mount Assembly Configurations (Pages 5-12) for correct orientation and mounting hole configuration.

8. Center and level the mounting plate with respect to the input shaft. Reference previous section on (Page 1) for methods description.

9. Tighten all bolts. Reference Table 2 for recommended bolt torques.

10. Replace key to input shaft.

11. Place fan on shaft.

   a. Reducer was modified at factory for fan requirements
   (1) Locate the set screw which is 90° from the keyway on the fan to the spotting hole on the shaft.
   (2) Tighten set screws.

   b. Reducer needs to be modified for fan requirements
   (1) From the chart (below), determine the distance from the end of the input shaft to the front edge of the fan.

   (2) Position the fan on the input shaft to the determined distance.
(3) With fan in place, tighten set screw that is located 90° from the keyway so that it makes a mark on the shaft.

(4) Remove fan.

(5) With a 1/8" (3 mm) drill, make a small indentation on the surface of the shaft at the set screw mark.

(6) With a 5/16" (8 mm) drill, enlarge the indentation made by the 1/8" (3 mm) drill (approximately 1/16" to 1/8" [2 mm to 3 mm] deep).

(7) Place fan on shaft.

(8) Locate the set screw which is 90° from the keyway on the fan to the spotting hole on the shaft.

(9) Tighten set screws.

NOTE: At this time it is necessary to modify the fan shroud in order to attach the fan shroud to the reducer. Refer to Planetgear 7000 drawing number 18840058 (Page 13) for the modification details that correspond to a specific reducer size.

12. With tin snips or equivalent, cut away material from the fan shroud as shown in Planetgear 7000 drawing number 18840058.

13. Position the fan shroud so that it fits tight over the shroud clips and also to insure that when the input shaft is rotated, the fan does not interfere with the shroud. Gently bend the shroud clips to position the shroud.

NOTE: If the shroud clips are mounted over the mounting bracket (as described in Figure 4) then the fan shroud mounting holes need to be relocated for those position.

14. With a marker on an extension rod, go between the fan and the shroud to mark the position of the shroud clips. Reference Figure 5.

ATTACHING COUPLING AND COUPLING GUARD

Mount the reducer coupling hub on the input shaft and the motor coupling hub on the motor shaft as instructed in the manual shipped with the coupling. If the coupling is not a Rexnord Omega™, refer to the manufacturers literature for installation instructions. If Rexnord does not mount the motor, the couplings are mounted for shipment only. Coupling bolts and coupling instructions are packed inside the coupling elements. Note: Prior to the installation of the element, check both coupling hubs for the required parallel and angular alignment.

1. When the coupling is in place, position the coupling guard over the coupling so that the coupling is centered inside the guard and the opening of the guard centers on the shafts.

2. Mark the position where the mounting holes lie on the scoop mounting plate.

3. Drill the proper size holes in the mounting plate. Tap threads in mounting plate if preferred.

4. Attach coupling guard to mounting plate using the correct fasteners. Refer to Table 2 for recommended bolt torques.

WARNING: All rotating equipment must be properly guarded in accordance with OSHA standards. Failure to do so may result in personal injury or property damage.

15. Remove the shroud. Center punch and drill new 3/8" mounting holes at the marked shroud clip positions.

16. Position and attach the fan shroud. Install remote grease line.
MOUNTING OF TRANSMISSION ACCESSORIES

WARNING: When the Planetgear 7000 speed reducer is connected to a motor or driven equipment through the use of couplings, sprockets, gears or belt drives, all rotating parts must be properly guarded with guarding that conforms to OSHA requirements to prevent personal injury or property damage.

When direct coupling motors to the Planetgear 7000 reducer, follow the four step process shown below to achieve proper motor to reducer alignment. Refer to coupling manufacture specifications to determine required alignment accuracy.

NOTE: Steps 1 to 4 may have to be repeated several times to achieve manufacturers required accuracies.

STEP #1 (Side View Plane)

Correct for **angular** misalignment in the **side view plane**.

STEP #2 (Side View Plane)

Correct for **parallel** misalignment in the **side view plane**.

STEP #3 (Top View Plane)

Correct for **angular** misalignment in the **top view plane**.

STEP #4 (Side View Plane)

Correct for **parallel** misalignment in the **top view plane**.
