

Rexnord Premium Services and Smart Condition Monitoring System

When conveying equipment begins to wear, there is little warning before they require maintenance, or fail altogether. These unplanned surprises jump start a chaotic sequence of events to identify, purchase, receive parts and repair the problem — costing you money for lost production, administration and labor time.

Monitor in Real Time. Plan for the Future.

The full-service premium solutions package includes real-time monitoring of your conveyor chain and components through the Rexnord® Smart Condition Monitoring System, Powered by DiRXN®. A Rexnord Edge device ensures prediction and anticipation of chain failure long before downtime occurs. Real-time visualization of performance through the Rexnord Connect portal helps see when and where maintenance is needed to avoid premature (or overdue) deployment of your labor resources. In the event immediate maintenance is needed, the Rexnord Edge Device will send an alert for an urgent maintenance event.

Instantaneous Part Identification with a Single Scan.

The base of all premium service offering starts with a full line survey and asset tagging. At your operation's convenience, a Rexnord Application Engineering expert inventories all Rexnord products on your line, and tags them with QR codes. Your post-survey report is then uploaded to the Rexnord Connect Portal and includes a listing of all Rexnord products on your line, the current condition assessment of those products. With all products tagged, you're ready to scan any QR code and check the portal for instant product information including serial numbers, product descriptions and support documentation.
